close to you

Design & Creation

**FREEDOM IN
DESIGN**

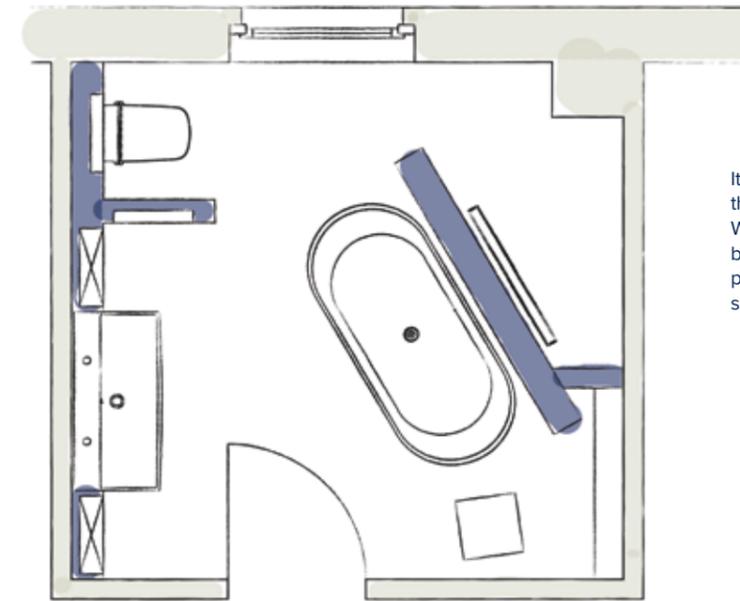

CLOSE TO YOU.

Understanding people and their requirements – that is what motivates us.

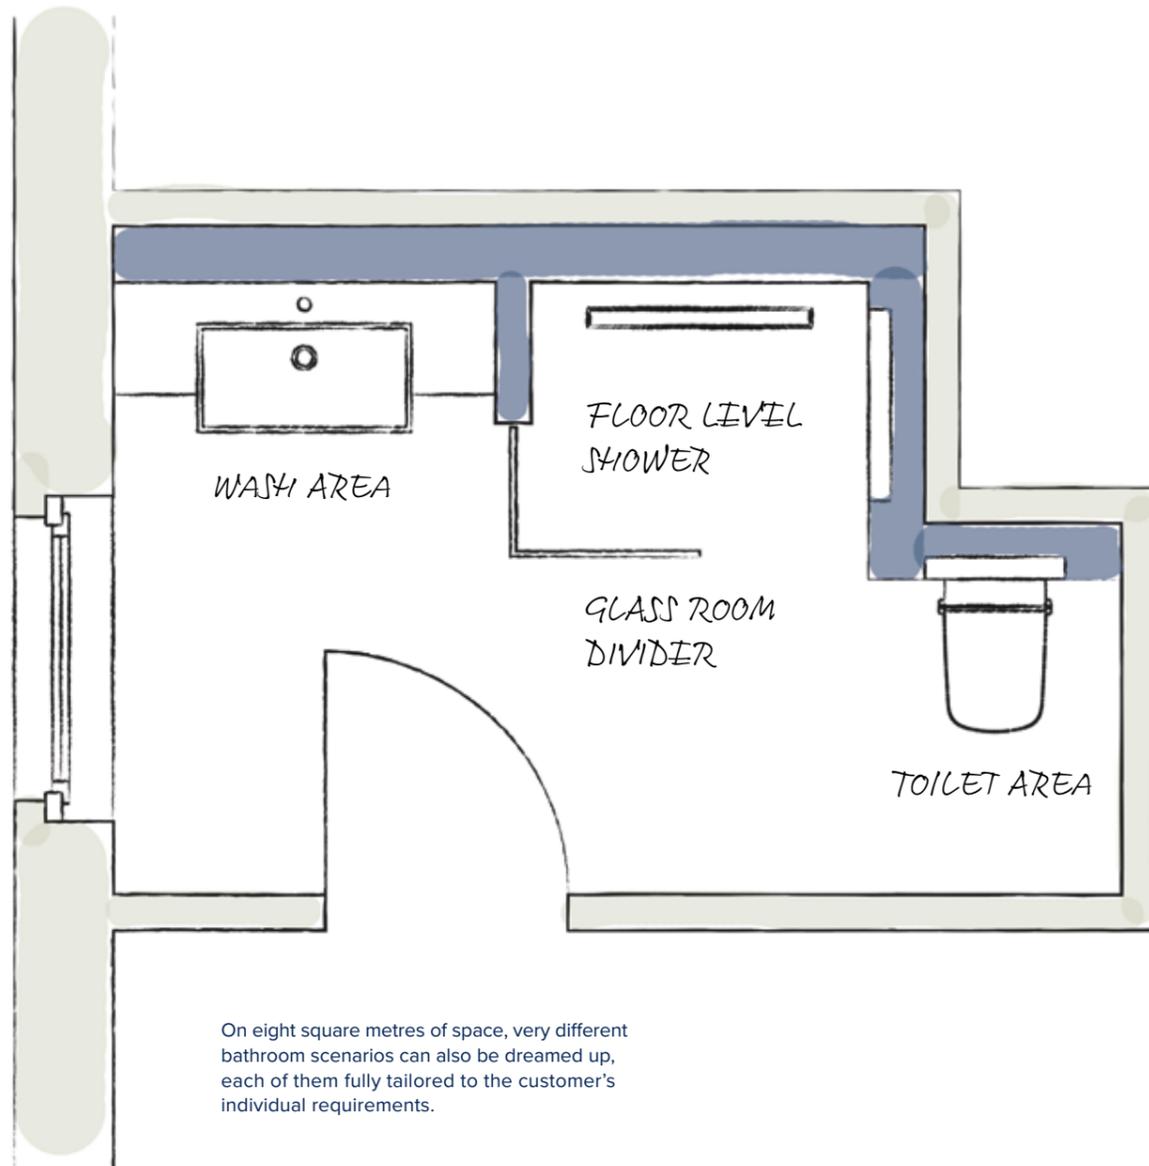

In this spirit, and with our customers in mind, we develop products and services that offer more room for creativity and convenience in terms of use.

BATHROOMS WITHOUT BARRIERS.

Totally new bathroom layouts can be designed thanks to our pre-wall systems. The use of pre-wall elements allows for customised interior design as they mean that predetermined installations or housing technology no longer have to be strictly followed. The layout of main usage areas such as the wash area, toilet, bath or shower can be completely rethought and re-structured.

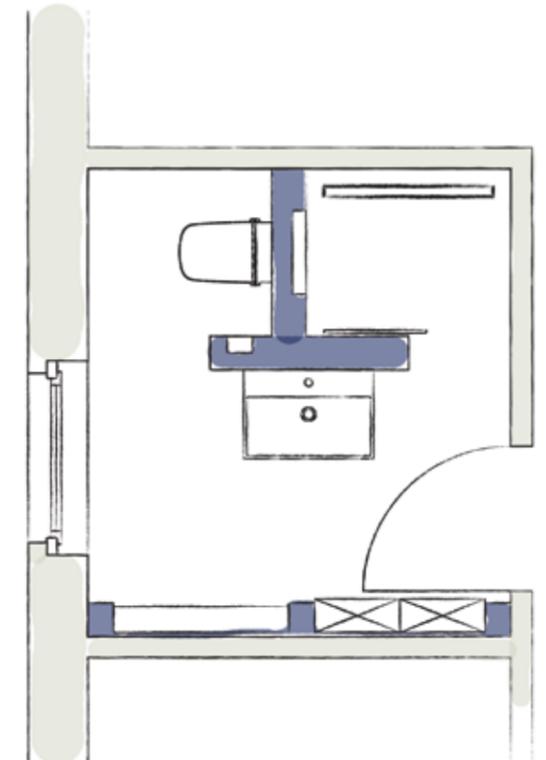

It does not always have to be set along the wall: the bath takes up a lot of space in the bathroom. With the aid of a pre-wall system, positioning the bath in the centre of the room no longer poses a problem and leaves plenty of room for a floor-level shower too.

On eight square metres of space, very different bathroom scenarios can also be dreamed up, each of them fully tailored to the customer's individual requirements.

Customised possibilities

New builds or renovations: Through the interaction of wall sections, sanitary systems and shower channels, smaller rooms can also be supplied with all the mod cons and be made to look larger.

Accessible bathrooms can also be tailor-made. The wash area becomes an element that divides the room, set against a centrally-located pre-wall element. The toilet area is no longer directly visible, and the floor-level shower is visually unobtrusive while enabling maximum freedom of movement.

THE PATH TO THE BATH.

From the first sketches to the finished bathroom, the process should be as easy as possible. A well-thought-out product system facilitates each step when planning the bathroom.

“Today, the requirements for modern bathrooms are much more demanding than just a few years ago. An unobstructed interior design and efficient planning of all the details are extremely important.”

Joerg Verwolth, Architect and member of the BDA (German Architect's Association)

The contemporary bathroom

Contemporary bathroom design does not mean building extraordinary bathrooms. It is far more important to plan and design a room with the long term in mind. The bathroom must be able to adapt to every life situation – freedom from limitations is the keyword here – you never know when you may want to modernise certain elements without having to rip everything off the wall. The size of the bathroom is not important. Above all, everything depends on ensuring efficient use of space.

Simple and efficient designs

The process is assisted by sophisticated products and planning systems which are actually designed to use space intelligently. The shower area provides a good example of a room which can be further developed. Demarcated wet areas can be designed with free-standing pre-wall systems, shower channels enable a continuous and generous space; and easy access also facilitates practical cleaning. In the home, a rented flat or a hotel en-suite bathroom.

Finally, a good bathroom design also clearly depends on the choice of colours and materials – i.e. that extra little something that enhances individuality. In each case, more than ever before, the bathroom is an expression of personality, and increasing requirements demand well-thought-out solutions.

Bathrooms in the housing sector

A universal bathroom design not only offers convenience for tenants but also increases the property's overall value. People from all generations feel at home in this type of bathroom.

1

A bathroom for all generations

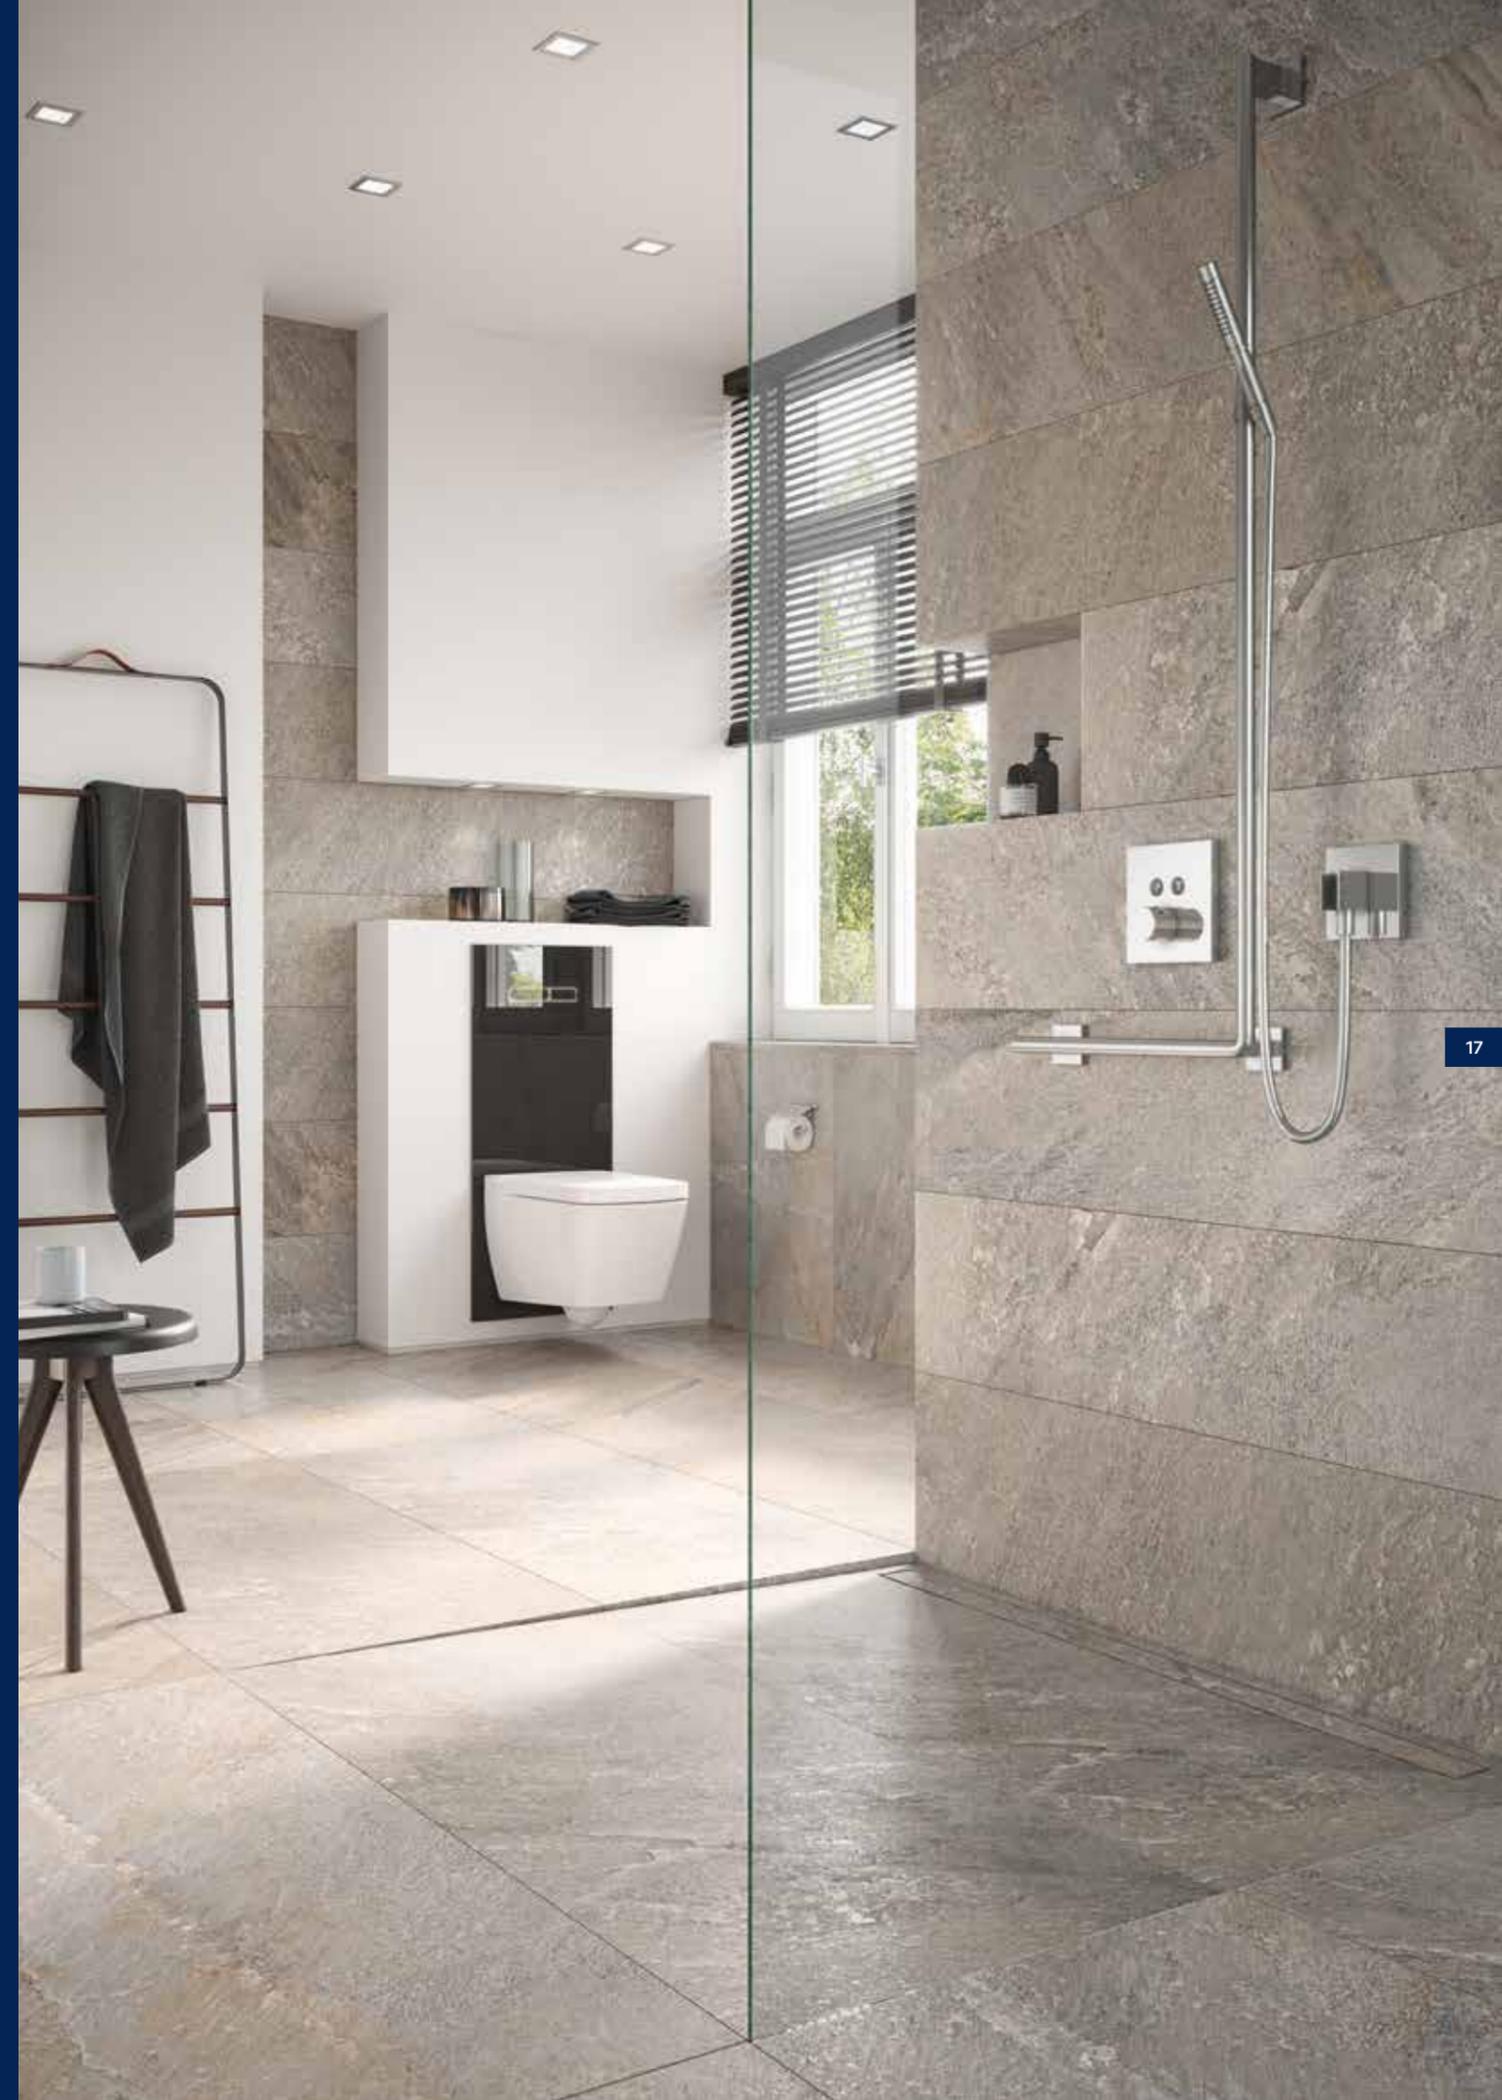

Accessible layouts offer universal value. The associated level of comfort is not a question of age or disability. In the bathroom, easy access for every user offers a pleasant experience for children, adults and senior citizens alike.

FREEDOM IN DESIGN

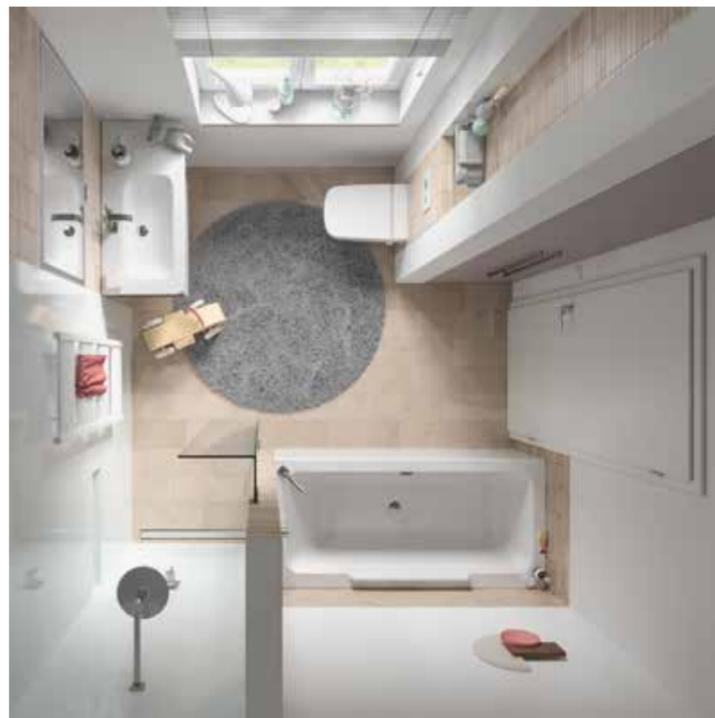

INDIVIDUALITY & DESIGN

Designs with personality.

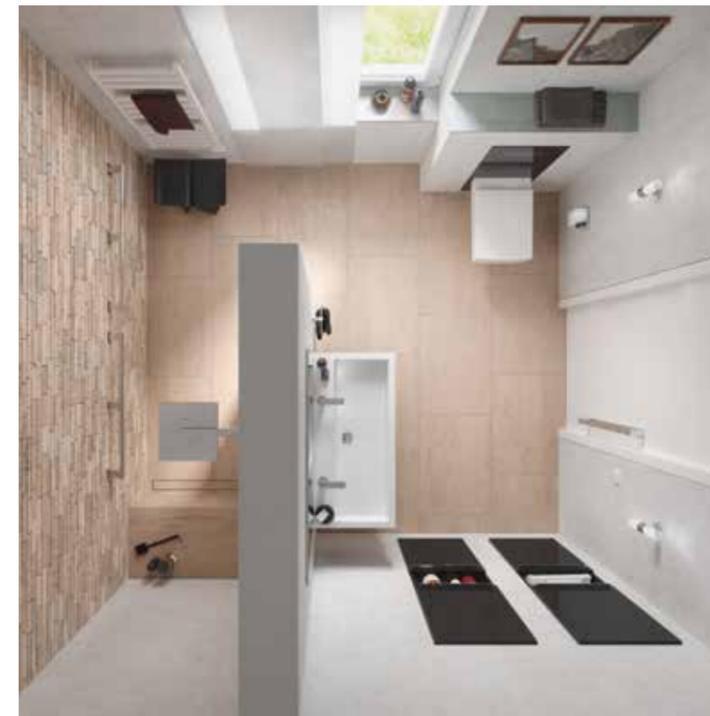

A BATHROOM IS A PERSONAL THING.

The floor space may well be predetermined, but this is not the case for the bathroom's design. TECE products are aimed at enabling fully customised concepts to be created while sticking to the specified budget.

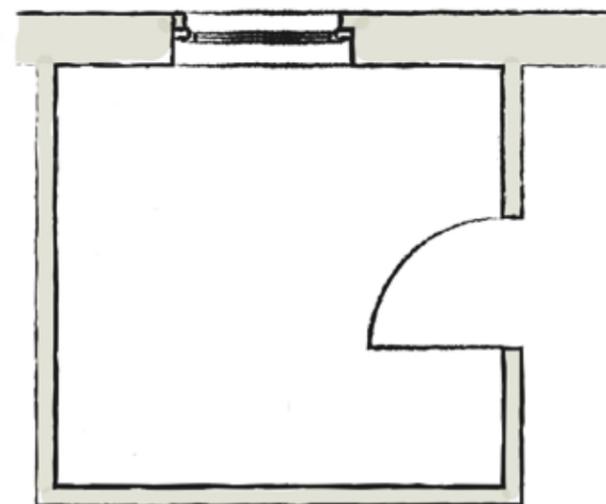

A family bathroom suitable for everyday life

In homes with children, in addition to convenience and safety, easy operation is another important aspect. For this type of project with average budgets, TECE has a wide range of solutions at the ready.

Convenience in all living situations

In renovation projects, city apartments are increasingly being converted into more accessible spaces. Owners often have high expectations in terms of convenience and aesthetics – along with the corresponding budget.

Efficiency in terms of function and budget

When living away from home – whether for students or modern business nomads – every last square metre must be put to good use. With this in mind, the bathroom must also be well-thought-out without putting a strain on the budget.

HOTEL INSPIRATION.

Designing bathrooms for hotels is a particularly dynamic field. New concepts are always being tried out in this area, offering international guests a high level of attractiveness. However, attention must also be paid to efficiency.

For both aspects, TECE offers the right products.

Mr. Galal Mahmoud – President of GM Architects

Hotel design trends

In the field of hotel design, it is no longer just about designing rooms. It is now much more a case of creating a holistic experience from check-in to the bedroom and from the bathroom to the dining area. It is no longer enough for a hotel to be labelled “Business” or “Leisure”. Today, people want to escape from their routine and try out new things. And they now pay greater attention to well-being. Indeed, the interest in wellness and convenience is steadily increasing.

The result: Hotel rooms are now also required to emanate a greater sense of relaxation and cosiness, and to appear less business-like and uniform. New forms of wellness are becoming increasingly important. The hotel room is a comfort zone where function, intelligence and design are combined. A real place of retreat.

The living area is merging more and more with the bathroom, which makes the room appear more generous, while at the same time allowing greater privacy.

This creates new challenges for architects and planners, regardless of the category in which a property is located. The optimum solution for this can only be an integrative product system. All elements of the visible and non-visible layout are perfectly harmonised in terms of technology and functionality. This means that products from third party manufacturers can also be integrated via open interfaces without any problem.

This is precisely the task fulfilled by TECE product systems, which, at the same time, facilitate design and implementation.

Aesthetics is the new standard

In the hotel business, “standard” no longer means cutting back on aesthetics. Exciting designer bathrooms which are attractive for guests can even be found in basic hotel categories. And this guarantees capacity and turnover.

High demands

Modern luxury is distinguished by originality and special materials. The wide range of shapes, colours and surfaces available enables creative design. Alternative solutions, such as contact-free toilet flushing and walk-in showers, offer the highest level of convenience.

FREEDOM IN DESIGN

FUNCTION & INNOVATION

Safety in the system.

INNOVATION MEANS UNDERSTANDING.

The term “innovation” covers a wide spectrum of new developments which can range from platform technologies to playful subtleties. Whether or not such innovations also represent actual improvements is worked out in practice. TECE’s aspiration and incentive has always been to develop products and services that make sense and remain valuable in the long term through an accurate knowledge of customer requirements.

Less is more

The greatest skill of design lies in the art of reduction. TECE’s flush plates take this assertion on board. If desired, a special frame enables flush-mounted installation to the wall. For an unrestrictedly elegant and simple integration into any bathroom design.

Thinking out of the box

Toilets with a shower function have been a familiar sight in Asia for a long time. However, they are now also set to slowly conquer other cultures.

Up until now, they have been characterised by complex technology and an exuberant design, however, TECE is taking a different approach. TECEone does not require electricity or unnecessary gimmicks, which makes it suitable for a wide range of use. Timeless design included.

All inclusive toilet convenience

The TECElux toilet terminal offers the perfect combination of timeless design and sophisticated technology. The highlight: the latest technology is concealed in the pre-wall’s inspection opening behind the glass plate.

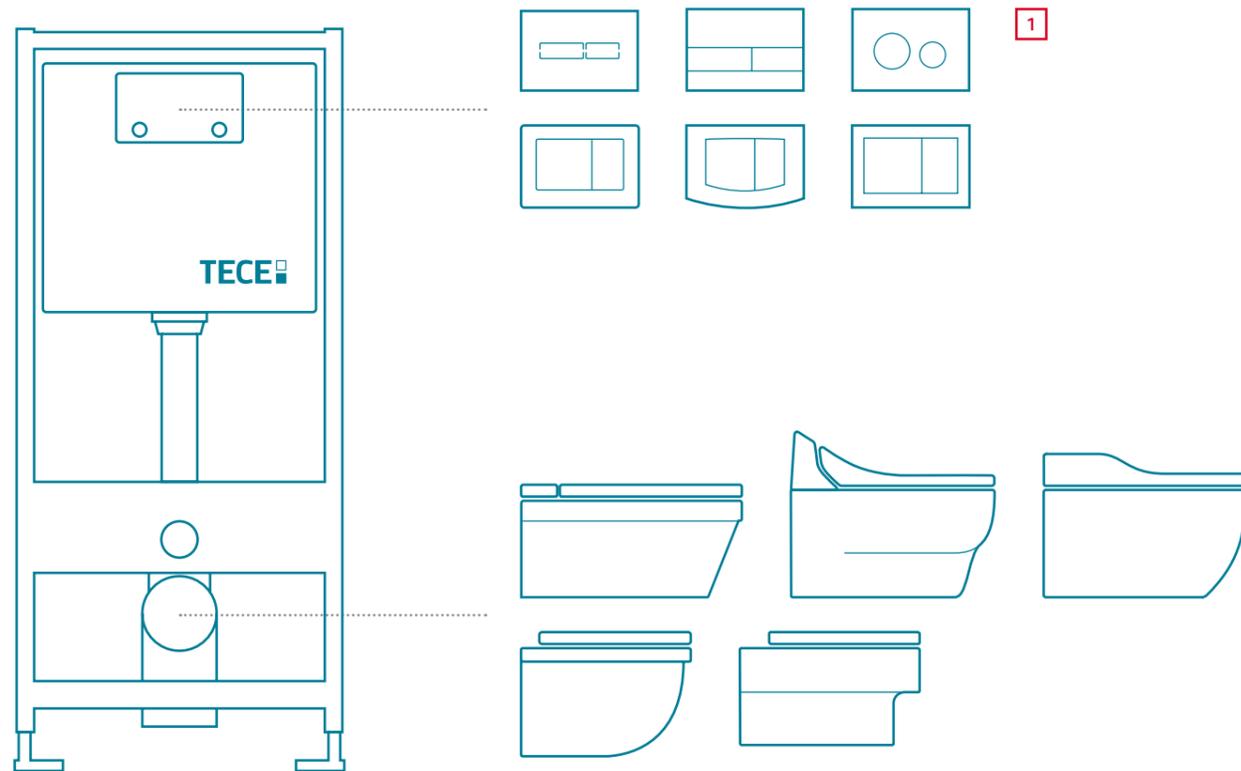

The result: contact-free flush actuation, a night light, odour trap, insert chute for cleaning tablets and smooth height adjustment.

ON THE SAFE SIDE.

TECE products meet the highest technical and quality requirements. They can be universally combined within the same range and are compatible with other products from the sanitary sector. This means perfect scalability and safe planning from the home to series housing construction.

Safety in the system

Because needs are changing in the private environment, bathroom designs are also frequently changing. TECE products take these changes in their stride: technology installed “in the wall” is guaranteed to be compatible with the toilet ceramics and flush plates “in front of the wall”.

- 1 All flush plates fit on all cisterns, all toilet ceramics fit on all modules. The TECE's modular design enables safe and easy planning and implementation.
- 2 Hardness testing in continuous operation. Demonstrated here, TECE's own test bench for flush plates and cisterns.

Safety in the product

Whether for private, public or commercial use, TECE products comply with the complete range of legally required approvals at an international level. Each product undergoes strict tests, from raw materials purchasing to the final disposal site. Only in this way can long-term operation and durability be guaranteed for every area of use.

Pushed to the limits

TECE operates a range of automated test benches for fatigue and hardness tests. These are used not only to determine the required standard values but also to establish the actual application limits of products and systems.

Recognised on an international scale

TECE products and systems are subjected to continuous in-house and external quality and standardisation tests. Independent testing bodies confirm compliance with international provisions by issuing approvals and certificates.

Signs of quality

International products require international approvals. For that reason, TECE's pipe systems are continuously monitored by a whole range of international external inspection bodies.
